Class Rank Calculations

The final grade averages for grades 9, 10, and 11 plus the cumulative average for the first 30 weeks in 12th grade will be added together and divided by 4. These averages will be used to rank the seniors including the Valedictorian and Salutatorian.

When computing averages:

Local level final grades will remain as they are.

Regents level final grades (if Regents exam is passed), Advance Placement grades and college final grades will be multiplied by 1.1. For example, a final grade of 88 in Course II Math would become 96.8 (88 X 1.1 = 96.8). This is done to give extra weighting to students who challenge themselves by taking the more difficult courses.
